

Online Education Empowers Traditional Education

-- Take Reading of Classics as An Example

Abstract

Facing the outbreak of the new crown pneumonia epidemic, schools have had to implement an online education model of "stopping classes without stopping school". Teachers and students cannot face each other, and teaching and learning are separated in time and space. How can they know how students are learning? How can students be guided to read independently and think deeply? The main idea: Summarize the problems encountered → find the core problem → seek solutions → predict the effect → make corrections → evaluate feedback. When it comes to reading masterpieces, what everyone is distressed about is what should students do if they don't read? What if I don't understand? What should I do if I don't have my own thinking after reading it? These problems that have been troublesome in traditional offline education still exist in online education. Moreover, without school supervision and more interaction between teachers and students in the classroom, the quality of reading is even more worrying. We should find the core of these issues and combine the advantages of online education to make breakthroughs.

Keywords

Online education; Traditional education; Reading masterpieces.

1. Introduction

The so-called "online teaching" is organized by class as a unit of teaching and two-way interaction, mainly recorded and broadcasted, and adopted the form of "recorded broadcast + online Q&A". This new teaching method is the need of the current prevention and control work, and it also poses new challenges to schools, teachers and students.

2. Core issues

How to enhance students' interest in reading so that they can read independently? (Question 1 for short) How to reasonably evaluate the reading level of students and guide students to read in depth through the evaluation? (Referred to as question 2)

Question 1 In short, the two words "stimulate interest". In order to stimulate students' interest, first of all, it is necessary to clarify what students are most interested in now? It can also be refined into a series of questions such as "What are the students at this age interested in here?" "What are men and women of different genders interested in?" "What are they most interested in during holidays?" After observation and reasoning, it was discovered that students are interested in keywords "animation", "chasing stars", "games", "chat", "focus on self-independent personality", "expecting others to identify with", etc. These keywords are internalized into student psychology and chasing animation The reason behind the star chasing is that he has found a kind of identity of his own value in the anime characters and idols, which means that they have their own "examples" and have begun to sprout what kind of person they

want to be. What kind of people do you want to make friends with, and what do you want to look forward to in the future world? Digging deeper, in fact, the students' three outlooks-"life outlook, world outlook, and values" have initially taken shape. So what are the students' current three views? In fact, most children are now pure in their minds, full of expectations for the future, and this kind of heroic complex, with especially precious youth ambitions. Then, the teacher should guide the students in a timely manner, so that the students' moral cultivation can be improved, and the internal driving force can be generated to drive the external learning activities. Then, properly integrate the content in "Water Margin" to make it meet the reading needs of students. For example, the hero quality that students pay attention to is implemented on each character, and it runs through the whole process of the character's explanation.

Question 2 is mainly to have an accurate grasp of the students' learning status. The best way is to let the students' thinking appear. The best way for students to think outside is to draw a mind map. In each class, students are asked to draw out the content of their reading masterpieces in time. The teacher classifies the students' works, and then classifies and tutors according to different students in different time periods.

3. Online Education Solution

Compared with traditional education, the biggest advantage of online education is that it extends the time and capacity of the classroom. Students can check and expand resources in time for things they are interested in, and they can also study and watch videos they are interested in repeatedly. Therefore, I have adopted the following methods to deal with this: (1) The classroom adopts the method of live broadcast + recording. The video of each lesson is recorded for the students, and the students can watch it repeatedly. During the live broadcast, the students are required to watch the recording. Feedback on the video side of their own problems, and finally give students interactive answers to questions at any time during class. (2) Change the capacity of class and cleverly drive students to study after class to increase class capacity. Make the video of each lesson as a TV series, and use some techniques appropriately, such as: In the production of the video screen, use more elements such as pictures and videos that students are interested in; set some suspense in each lesson in the plot to attract students In-depth thinking, the most important thing is to attract students to think in class, to check information, and to dig deeper. (3) Pay attention to details. For example, in online classes, students receive information through videos, and they have high requirements for voice. The language of the teacher's lecture can be slightly exaggerated than usual. The exaggeration here is not to say that it is necessary to make a speech, but to give students some retention Bai, let him have room for imagination, so when speaking, the ups and downs of the language, the tone of the language, etc. must be carefully considered; another example: whether students use computers or mobile phones to study, they are smaller than usual blackboard screens, and they are all closer. Distance, then the characters on the PPT should be designed, and special characters should be enlarged, color, and animation effects should be used to attract students' attention and avoid visual fatigue. (4) Personality counseling. The current online teaching is very suitable to be divided into tutoring and personalized tutoring. According to the students' respective problems, Tencent conferences will be opened at different times and direct tutoring will be provided.

4. Pre-judgment Adjustment

Online teaching is an extraordinary method in a special period. It is completely different from traditional "face-to-face" teaching. How to enable students to better complete their learning tasks at home requires teachers to make reasonable planning and arrangements in terms of teaching content and teaching methods. To this end, we have repeatedly adjusted our teaching

plan, created "online interaction" between teachers and students, increased communication, reduced the sense of distance, and continuously improved the effectiveness of "Chinese online teaching".

According to the "Compulsory Education Chinese Curriculum Standards (2011 Edition)", combined with students' winter vacation homework, we initially arranged two weeks of ancient poetry teaching, and then integrated the teaching content again based on the opinions of students and parents. In the first two weeks of "Chinese Online Teaching", we completed the poem teaching in the order of the textbooks, and carried out the three masterpieces that students read during the winter vacation-("Water Margin", "How Steel is Made" and "Fu Lei's Family Letters") Combing. Teachers from all campuses work together to grind the lessons repeatedly and carefully arrange the learning content of "Chinese online teaching".

General Secretary Xi Jinping emphasized at the National Education Conference: China is a socialist country under the leadership of the Communist Party of China, which determines that our education must take the training of socialist builders and successors as the fundamental task, and train generations to support the leadership of the Communist Party and our country. The socialist system is a useful talent who is determined to fight for socialism with Chinese characteristics for life.

In 2020, the Chinese people will be united and united. No country in the world is doing the same thing uniformly and uniformly like China. The "Compulsory Education Chinese Curriculum Standard (2011 Edition)" requires that in the process of Chinese learning, cultivate patriotism, collectivism, socialist ideology and morality and healthy aesthetic taste, and cultivate the emotion of loving the language of the motherland. Therefore, when designing the teaching, we incorporate the current clips that most inspire the patriotic emotions of students, such as "Vulcan Mountain Hospital Construction", "Students in Fangcai Hospital", "Serbian President Kissing the National Flag" and so on. In this way, we turn the Chinese classroom into a spiritual home for students' life growth, integrating knowledge value, method value, and emotional value.

5. Summary

After this period of online teaching, I have gained a lot. First of all, the method of live broadcast + recording has increased the classroom capacity; secondly, various online education technology platform software has helped teaching, such as the shared screen of the Tencent meeting and the homework display of the small housekeeper in the class. The works are shared so that everyone can learn from their peers.

In addition, it also gave me a lot of thinking: after students have been teaching online for such a long time, how can they plan ahead for the connection of student learning before the school starts? In the future of education, how can the use of technology be improved to enable assistant teaching? How to dig deeper into the self-driving force of students? In response to these problems, I then began to learn to carefully analyze the advantages and disadvantages of online education and traditional offline education, and the trend of future education; learn to use various technical software, broaden teaching methods; learn more about psychology professional knowledge, and pay more attention to the lives of young people , To scientifically understand the students' thinking quality at this stage, and then to scientifically improve students' abilities.

Students are the main body of the teaching process and the master of homework. Teachers should turn passive homework into guided homework that students are full of interest. Especially "Chinese students are the main body of the teaching process, but also the masters of the homework. Teachers should turn passive homework into a guided homework full of interest for students. Especially for "Chinese online teaching", we can't see the students at all. , Assigning too many mechanical homework will only make students feel boring. We must work

hard to make students treat homework as a kind of fun, so that they can complete their homework on their own.

There are still many shortcomings in our "Chinese online teaching", such as: insufficient pertinence of tutoring, inadequate training of "listening, speaking, reading, and writing" skills, etc. Finally, we must continue to promote the scientific, standardized and high-quality online teaching, and steadily improve the quality of teaching.
